(解答は解答用紙に記入すること)

I 次の英文を読んで、(問1)～(問8)の設問に答えなさい。

Never before have so many people been packed into cities — places such as Los Angeles, Istanbul, Tokyo, and Lima — that are (1) regularly affected by earthquakes. (A) Located near the edge of Earth's huge, shifting plates, these cities face the risk of serious damage and (2) economic disaster from large quakes — as well as the tsunamis, fires, and other kinds of destruction they often cause.

We understand earthquakes better than we did a century ago. Scientists would like to be able them, but is this possible? Today, some of the simplest questions about earthquakes are still difficult to answer: Why do they start? What makes them stop? Perhaps the most important question (B) scientists need to answer is this: Are there clear patterns in earthquakes, or are they (3) basically random and impossible ?

In Japan, government scientists say they have an answer to the question. “We believe that earthquake is possible,” says Koshun Yamaoka, a scientist at the Earthquake Research Institute at Tokyo University. In fact, Japan has already predicted (C): the region of Tokai southwest of Tokyo. Here, two plate boundaries have (4) generated huge earthquakes every 100 to 150 years, but there hasn't been a major quake here since 1854. The theory is (D) stress is building up in this zone, which could (5) lead to a massive quake. Unfortunately, this is more a forecast than a . It's one thing to say that an earthquake is likely to happen in a high-risk area. It's another exactly where and when the quake will occur.
